[Astrocytoma - Childhood - Symptoms and Signs](#) [1]

This section has been reviewed and approved by the [Cancer.Net Editorial Board](#) [2], 03/2016

ON THIS PAGE: You will find out more about body changes and other things that can signal a problem that may need medical care. To see other pages, use the menu.

Children with astrocytoma may experience the following symptoms or signs. Sometimes, children with astrocytoma do not have any of these changes. Or, the cause of a symptom may be another medical condition that is not a tumor.

- Headaches
- Feeling tired and listless
- Seizures not related to a high fever
- Eyesight problems, such as double vision
- Changed growth or development

In a baby, the only symptom may be that the head is growing too fast. An infant's skull can expand to make room for a growing tumor in the brain. So, a baby with astrocytoma may have a larger than expected head.

If you are concerned about any changes your child experiences, please talk with your child's doctor. The doctor will ask how long and how often your child has been experiencing the symptom(s), in addition to other questions. This is to help find out the cause of the problem, called a [diagnosis](#) [3].

If a tumor is diagnosed, relieving symptoms remains an important part of care and treatment. This may also be called symptom management, palliative care, or supportive care. Be sure to talk with the health care team about symptoms your child experiences, including any new symptoms or a change in symptoms.

The [next section in this guide is Diagnosis](#) [3]. It explains what tests may be needed to learn more about the cause of the symptoms. Or, use the menu to choose another section to continue reading this guide.
