

Breast Cancer - Inflammatory - Risk Factors [1]

This section has been reviewed and approved by the [Cancer.Net Editorial Board](#) [2], 08/2014

ON THIS PAGE: You will find out more about the factors that increase the chance of developing this type of cancer. To see other pages, use the menu on the side of your screen.

A risk factor is anything that increases a person's chance of developing cancer. Although risk factors often influence the development of cancer, most do not directly cause cancer. Some people with several risk factors never develop cancer, while others with no known risk factors do. However, knowing your risk factors and talking about them with your doctor can help you make more informed lifestyle and health care choices.

The risk factors for inflammatory breast cancer are the same as those for [other forms of breast cancer](#) [3]. It is not known what specific factors can raise a person's risk of inflammatory breast cancer. A family history of breast cancer in general may increase the risk of developing inflammatory breast cancer, but no specific genetic mutations or changes have been found for this type of breast cancer. However, women with genetic mutations that increase the risk of breast cancer also have a higher risk of developing inflammatory breast cancer.
