After treatment for an islet cell tumor ends, talk with your doctor about developing a follow-up care plan. This plan may include regular physical examinations and/or medical tests to monitor your recovery for the coming months and years.

ASCO offers [treatment summary forms](#) [3] to help keep track of the treatment you received and develop a survivorship care plan once treatment is completed.

While there are no established guidelines for follow-up care after treatment of an islet cell tumor, people who have had surgery should be seen by their doctor three months after their operation for a physical examination, blood tests, and CT scan. After that, follow-up care should include a physical examination and blood tests about every six to 12 months, with additional imaging tests, such as x-rays, on an as-needed basis.

People recovering from an islet cell tumor are encouraged to follow established guidelines for good health, such as maintaining a healthy weight, not smoking, eating a balanced diet, and having recommended cancer screening tests. Talk with your doctor to develop a plan that is best for your needs. Moderate physical activity can help rebuild your strength and energy level. Your doctor can help you create an appropriate exercise plan based upon your needs, physical abilities, and fitness level.
