

Lymphoma - Hodgkin - Symptoms and Signs [1]

This section has been reviewed and approved by the [Cancer.Net Editorial Board](#) [2], 06/2014

ON THIS PAGE: You will find out more about body changes and other things that can signal a problem that may need medical care. To see other pages, use the menu on the side of your screen.

People with Hodgkin lymphoma may experience the following symptoms or signs. Sometimes, people with Hodgkin lymphoma do not show any of these symptoms, or these symptoms may be caused by a medical condition that is not cancer. Common symptoms caused by Hodgkin lymphoma include:

- Painless swelling of lymph nodes in the neck, underarm, or groin area that does not go away within a few weeks
- Unexplained fever that does not go away
- Unexplained weight loss
- Night sweats, usually drenching
- Pruritus, a generalized itching that may be severe
- Fatigue
- Pain in the lymph nodes triggered by alcohol intake

If the lymph nodes in the chest are affected, they may press on structures in the lung and cause shortness of breath, cough, or chest discomfort.

If you are concerned about one or more of the symptoms or signs on this list, please talk with your doctor. Your doctor will ask how long and how often you've been experiencing the symptom(s), in addition to other questions. This is to help find out the cause of the problem, called a [diagnosis](#) [3].

The doctor may also use certain symptoms to help describe the disease in a process known as [staging](#) [4]. Each stage may be subdivided into "A" and "B" categories.

A means that a person has not experienced B symptoms, listed below.

B means that a person has experienced one or more of the following symptoms:

- Unexplained weight loss of more than 10% of original body weight during the six months

before diagnosis

- Unexplained fever, with temperatures above 38° C (100.4° F)
- Drenching night sweats. Most patients say that their nightclothes or the sheets on the bed are wet enough to have to change them during the night. Sometimes, heavy sweating occurs during the day.

If cancer is diagnosed, relieving symptoms remains an important part of cancer care and treatment. This may also be called symptom management, palliative care, or supportive care. Be sure to talk with your health care team about symptoms you experience, including any new symptoms or a change in symptoms.

The next section helps explain what tests and scans may be needed to learn more about the cause of the symptoms. Use the menu on the side of your screen to select Diagnosis, or you can select another section, to continue reading this guide.
