Osteosarcoma - Childhood - About Clinical Trials [1]

This section has been reviewed and approved by the [Cancer.Net Editorial Board](#) [2], 11/2015

ON THIS PAGE: You will learn more about clinical trials, which are the main way that new medical approaches are tested to see how well they work. To see other pages, use the menu on the side of your screen.

Doctors and scientists are always looking for better ways to treat children and teens with osteosarcoma. To make scientific advances, doctors create research studies involving volunteers, called clinical trials. In fact, every drug that is now approved by the U.S. Food and Drug Administration (FDA) was previously tested in clinical trials.

Many clinical trials are focused on new treatments, evaluating whether a new treatment is safe, effective, and possibly better than the current (standard) treatment. These types of studies evaluate new drugs, different combinations of existing treatments, new approaches to radiation therapy or surgery, and new methods of treatment. Children and teens who participate in clinical trials are often among the first to receive new treatments before they are widely available. However, there is no guarantee that the new treatment will be safe, effective, or better than a standard treatment.

There are also clinical trials that study new ways to ease symptoms and side effects during treatment and manage the late effects that may occur after treatment. Talk with your child's doctor about clinical trials regarding side effects.

Deciding to join a clinical trial

People decide to participate in clinical trials for many reasons. For some, a clinical trial is the best treatment option available. Because standard treatments are not perfect, people are often

willing to face the added uncertainty of a clinical trial in the hope of a better result. Other people volunteer for clinical trials because they know that these studies are the only way to make progress in treating osteosarcoma. Even if they do not benefit directly from the clinical trial, their participation may benefit future children and teens with osteosarcoma.

Sometimes people have concerns that, in a clinical trial, their child may receive no treatment by being given a placebo or a “sugar pill.” The use of placebos in cancer clinical trials is rare overall and especially uncommon in childhood cancer research. Find out more about [placebos in cancer clinical trials](#) [3].

Patient safety and informed consent

To join a clinical trial, parents and children must participate in a process known as informed consent. During informed consent, the doctor should list all of the child’s options so that the parent and child understand how the new treatment differs from the standard treatment. The doctor must also list all of the risks of the new treatment, which may or may not be different than the risks of the standard treatment. Finally, the doctor must explain what will be required of each child in order to participate in the clinical trial. This includes the number of doctor visits, tests, and the schedule of treatment.

Patients who participate in a clinical trial may stop participating at any time for any personal or medical reason. This may include that the new treatment is not working or there are serious side effects. Clinical trials are also closely monitored by experts who watch for any problems with each study. It is important that parents of a child participating in a clinical trial talk with their child’s doctor and the researchers about who will be providing their child’s treatment and care during the clinical trial, after the clinical trial ends, and/or if they choose to leave the clinical trial before it ends.

Finding a clinical trial

Research through clinical trials is ongoing for all types of cancer. For specific topics being studied for osteosarcoma, learn more in the [Latest Research](#) [4] section.

Cancer.Net offers a lot of information about cancer clinical trials in other areas of the website, including a [complete section on clinical trials](#) [5] and [places to search for clinical trials for a specific type of cancer](#) [6].

The [next section in this guide is Latest Research](#) [4], and it explains areas of scientific research currently going on for this type of cancer. Or, use the menu on the side of your screen to choose another section to continue reading this guide.
