

Ovarian Cancer - Overview [1]

This section has been reviewed and approved by the [Cancer.Net Editorial Board](#) [2], 05/2013

ON THIS PAGE: You will find some basic information about this disease and the parts of the body it may affect. This is the first page of Cancer.Net's Guide to Ovarian Cancer. To see other pages, use the menu on the side of your screen. Think of that menu as a roadmap to this full guide.

About the ovaries

A woman's ovaries are glands that contain the germ cells or eggs. Every woman has two ovaries as part of her reproductive system, one located on each side of the uterus. They are almond shaped and about one and a half inches long. Every month, during ovulation, an egg is released from an ovary and travels to the uterus through a structure called the fallopian tube.

Ovaries are the primary source of a woman's sex hormones, estrogen and progesterone. These hormones influence breast growth, body shape, and body hair, and regulate the menstrual cycle and pregnancy. During menopause, the ovaries stop releasing eggs and producing sex hormones.

About ovarian cancer

Ovarian cancer begins when normal cells in an ovary change and grow uncontrollably, forming a mass called a tumor. A tumor can be benign (noncancerous) or malignant (cancerous, meaning it can spread to other parts of the body). Removing the ovary or the part of the ovary where the tumor is located can treat a noncancerous ovarian tumor. An ovarian cyst, which forms on the surface of the ovary, is different than a noncancerous tumor and usually goes away without treatment. An ovarian cyst is not cancerous.

Types of ovarian cancer include:

Epithelial carcinoma. Epithelial carcinoma makes up 85% to 90% of ovarian cancers. This type of cancer typically begins in cells on the outer surface of the ovary. Epithelial ovarian cancer is usually known for starting in the ovary. However, new evidence suggests at least some of ovarian cancer actually begins in special cells in the fallopian tube. These cells are near the ovary and may go to the surface of the ovary early in the cancer process. Therefore, the term 'ovarian cancer' is often used to describe epithelial cancers that begin in the ovary, in the fallopian tube

[3], and from the lining of the abdominal cavity, call the peritoneum.

Germ cell tumor [4]. This uncommon type of ovarian cancer develops in the egg-producing cells of the ovaries. This type of tumor is more common for women ages 10 to 29.

Stromal tumor [5]. This rare form of ovarian cancer develops in the connective tissue cells that hold the ovaries together and make female hormones.
