

Skin Cancer (Non-Melanoma) - Side Effects [1]

This section has been reviewed and approved by the [Cancer.Net Editorial Board](#) [2], 12/2013

ON THIS PAGE: You will find out more about steps to take to help cope with physical, social, and emotional side effects. This page includes several links outside of this guide to other sections of this website. To see other pages, use the menu on the side of your screen.

[Fear of treatment side effects](#) [3] is common after a diagnosis of cancer, but it may be helpful to know that preventing and controlling side effects is a major focus of your health care team. This is called palliative or supportive care, and it is an important part of the overall treatment plan, regardless of the stage of disease.

Common side effects for each treatment option for non-melanoma skin cancer are described in the [Treatment Options](#) [4] section. Learn more about [the most common side effects of cancer and different treatments, along with ways to prevent or control them](#) [5]. Side effects depend on a variety of factors, including the cancer's stage, the type of treatment(s), and your overall health.

Before treatment begins, talk with your doctor about possible side effects of the specific treatment you will be receiving. Ask which side effects are most likely to happen, when they are likely to occur, and what can be done to prevent or relieve them. And, ask about the level of caregiving you may need during treatment and recovery, as family members and friends often play an important role in the care of a person with cancer. Learn more about [caregiving](#) [6].

In addition to physical side effects, there may be psychosocial (emotional and social) effects as well. Patients and their families are encouraged to share their feelings with a member of their health care team who can help with [coping strategies](#) [7]. Learn more about the importance of [addressing such needs](#) [8], including concerns about [managing the cost of your cancer care](#) [9].

During and after treatment, be sure to tell the health care team about the side effects you experience, even if you feel they are not serious. Sometimes, side effects can last beyond the treatment period, called a long-term side effect. A side effect that occurs months or years after treatment is called a [late effect](#) [10]. Treatment of both types of effects is an important part of survivorship care. Learn more by reading the [After Treatment](#) [11] section or talking with your doctor.

The next section helps explain medical tests and check-ups needed after finishing cancer treatment. Use the menu on the side of your screen to select [After Treatment](#), or you can select another section, to continue reading this guide.
