

[Testicular Cancer - Symptoms and Signs](#) [1]

This section has been reviewed and approved by the [Cancer.Net Editorial Board](#) [2], 08/2015

ON THIS PAGE: You will find out more about body changes and other things that can signal a problem that may need medical care. To see other pages, use the menu on the side of your screen.

Men with testicular cancer may experience a variety of symptoms or signs. Sometimes, men with testicular cancer do not show any of these symptoms. In addition, these symptoms can be caused by other conditions besides cancer, so the presence of these symptoms does not mean that a man has cancer.

Usually, the first sign of testicular cancer is enlargement of the testicle or a small lump or area of hardness on the testicle. Any lump, enlargement, hardness, pain, or tenderness of the testicle should be evaluated by a doctor as soon as possible. Other symptoms of testicular cancer usually do not appear until after the cancer has spread to other parts of the body.

Symptoms of testicular cancer may include:

- Painless lump or swelling on either testicle. If detected early, a testicular tumor may be about the size of a pea or a marble, but it can grow much larger.
- Pain or discomfort, with or without swelling, in a testicle or the scrotum.
- Change in the way a testicle feels or a feeling of heaviness in the scrotum. For example, one testicle may become more firm than the other testicle. Or, testicular cancer may cause

the testicle to grow bigger or to become smaller.

- Dull ache in the lower abdomen or groin
- Sudden buildup of fluid in the scrotum
- Breast tenderness or growth. Although rare, some testicular tumors produce hormones that cause breast tenderness or growth of breast tissue, a condition called gynecomastia.
- Lower back pain, shortness of breath, chest pain, and bloody sputum or phlegm can be symptoms of later-stage testicular cancer.
- Swelling of one or both legs or shortness of breath from a blood clot can be symptoms of testicular cancer. A blood clot in a large vein is called deep venous thrombosis or DVT. A blood clot in an artery in the lung is called a pulmonary embolism and causes shortness of breath. For some young or middle-aged men, developing a blood clot may be the first sign of testicular cancer.

Many symptoms and signs of testicular cancer are similar to those caused by noncancerous conditions. These are discussed below:

- Change in size or lump
 - A cyst called a spermatocele that develops in the epididymis. The epididymis is a small organ attached to the testicle that is made up of coiled tubes that carry sperm away from the testicle.
 - An enlargement of the blood vessels from the testicle called a varicocele.
 - A buildup of fluid in the membrane around the testicle called a hydrocele.
 - An opening in the abdominal muscle called a hernia.
- Pain

- Infection. Infection of the testicle is called orchitis. Infection of the epididymis is called epididymitis. If infection is suspected, a patient may be given a prescription for antibiotics. If antibiotics do not solve the problem, tests for testicular cancer are often needed.
- Injury
- Twisting

If you are concerned about one or more of the symptoms or signs discussed in this section, please talk with your doctor. Your doctor will ask how long and how often you've been experiencing the symptom(s), in addition to other questions. This is to help find out the cause of the problem, called a [diagnosis](#) [3].

If cancer is diagnosed, relieving symptoms remains an important part of cancer care and treatment. This may also be called symptom management, palliative care, or supportive care. Be sure to talk with your health care team about symptoms you experience, including any new symptoms or a change in symptoms.

The [next section in this guide is Diagnosis](#) [3] and it explains what tests may be needed to learn more about the cause of the symptoms. Or, use the menu on the side of your screen to choose another section to continue reading this guide.
