

Non-Hodgkin Lymphoma

What is non-Hodgkin lymphoma?

Non-Hodgkin lymphoma (NHL) is a group of cancers of the lymphatic system in which B cells, T cells, or NK cells in the lymphatic system change and grow out of control, sometimes forming a tumor. B-cell lymphoma is the most common type of NHL. T-cell lymphoma is less common, and NK-cell lymphoma is relatively rare. Because of the many types and subtypes of NHL, it is important to know the exact diagnosis.

What is the function of the lymphatic system?

The lymphatic system is made up of thin tubes and groups of tiny, bean-shaped organs called lymph nodes that are located throughout the body. The lymphatic system carries lymph, a clear fluid containing a type of white blood cell called lymphocytes that help fight infection. Because lymphatic tissue is found in most parts of the body, NHL can start almost anywhere.

What does stage mean?

Staging is a way of describing where the cancer is located, if or where it has spread, and whether it is affecting other parts of the body. There are 4 stages for NHL: stages I through IV (1 through 4). NHL is also described by how quickly the cancer is growing: indolent (slower growing) or aggressive (faster growing). A scale called the International Prognostic Index (IPI) is used to help predict the success of treatment for aggressive lymphomas. Find more information about NHL at www.cancer.net/nhl.

How is non-Hodgkin lymphoma treated?

The treatment of NHL depends on the type, subtype, and stage of NHL; possible side effects; and the person's overall health. Watchful waiting may be an option for some patients with slow-growing or indolent lymphoma who are otherwise healthy and do not have any symptoms. Chemotherapy is the main treatment for NHL. Radiation therapy is sometimes given after or during chemotherapy, depending on the subtype. Treatment may include immunotherapy/targeted therapy, such as monoclonal antibodies with or without chemotherapy, antibody drug conjugates, or radioimmunotherapy. Stem cell/bone marrow transplantation and surgery may also be considered. Talk with your doctor about all treatment options. The side effects of NHL treatment can often be prevented or managed with the help of your health care team. This is called palliative care and is an important part of the overall treatment plan.

How can I cope with non-Hodgkin lymphoma?

Absorbing the news of a cancer diagnosis and communicating with your health care team are key parts of the coping process. Seeking support, organizing your health information, making sure all of your questions are answered, and participating in the decision-making process are other steps. Talk with your health care team about any concerns. Understanding your emotions and those of people close to you can be helpful in managing the diagnosis, treatment, and healing process.

Questions to ask the health care team

Regular communication is important in making informed decisions about your health care. Consider asking the following questions of your health care team:

- What type and subtype of NHL do I have?
- Can you explain my pathology report (laboratory test results) to me?
- What stage is the lymphoma? What does this mean?
- Would you explain my treatment options?
- What clinical trials are open to me? Where are they located, and how do I find out more about them?
- What treatment plan do you recommend? Why?
- What is the goal of each treatment? Is it to eliminate the lymphoma, help me feel better, or both?
- Who will be part of my treatment team, and what does each member do?
- Do I need to begin treatment right away?
- How will this treatment affect my daily life? Will I be able to work, exercise, and perform my usual activities?
- Will this treatment affect my ability to become pregnant or have children?
- What other long-term side effects may be associated with my cancer treatment?
- What follow-up tests will I need, and how often will I need them?
- If I'm worried about managing the costs of cancer care, who can help me?
- Where can I find emotional support for me and my family?
- Whom should I call with questions or problems?

Additional questions to ask the doctor can be found at www.cancer.net/nhl.

WORDS TO KNOW

B cell:

A white blood cell that makes antibodies to fight disease

Biopsy:

Removal of a tissue sample that is then examined under a microscope to check for cancer cells

Chemotherapy:

The use of drugs to destroy cancer cells

Hematologist:

A doctor who specializes in treating blood disorders

Immunotherapy:

Treatment designed to boost the body's natural defenses to fight the cancer

Lymph node:

A tiny, bean-shaped organ that fights infection

NK cell:

A white blood cell that destroys viruses, infected cells, and some cancer cells

Oncologist:

A doctor who specializes in treating cancer

Radiation therapy:

The use of high-energy x-rays to destroy cancer cells

Stem cell transplant:

Procedure in which highly specialized cells, called hematopoietic stem cells, are used to treat cancer

T cell:

A white blood cell that directly fights disease
